

Q1a per-head and macro model comparison - WORKING FULL INVENTORY

Bars show saved-run means; whiskers show sample SD (n=3 per system). Model identities and scope are preserved from the input CSV. Blank cells are unverified working-layout placeholders; this preview is not coverage-complete and is not inserted into the manuscript. The reports/q1a_best_f1_table values are withheld pending Nash source/hash/protocol audit and are not used here.
